

## *I. The Immune system*

## II. Phases of the Adaptive Response

### 1. Induction (Priming) →

Primary response

- Naïve cells
- Quiescent
- Low precursor frequency ( $10^{-5}/10^{-6}$  lymphocytes)

-Low avidity Ag Receptors

-No effector functions

-Stringent activation requirements

Where: Secondary lymphoid Organs

How: Meeting with Ag+APC

### 2. Effector →

- Effector cells
- Hyper-Activated cells
- Clonal expansion: cell cycle
- Highest precursor frequency ( $10^{-2} / 10^{-4}$  lymphocytes)
- Selecting high avidity Ag receptors
- Effector functions (Cytokines, Help, Killing)
- Easy to trigger

-Secondary lymphoid Organs (CD4 helper, B cells);  
-Tissues (CD4, CD8 T cells)

-Meeting with target cells

### 3. Memory

Secondary response

- Activated cells
- Quiescent, long lived
- High precursor frequency ( $10^{-4}$  lymphocytes)

-High avidity Ag receptors

-Effector functions (Cytokines, Help, Killing)

-Patrolling lymphoid organs and tissues (central memory or effector memory T cells)  
-Resident in Bone Marrow (B cells plasmacells)

-Re-induced by APC in secondary lymphoid organs

### III. Phases of the Adaptive Response

#### 1. Induction (Priming)

In secondary lymphoids organs

#### 2. Effector

Clonal expansion

#### 3. Memory

Less clonally expanded

#### IV. How do Peripheral Antigens and Lymphocytes meet ?

## V. Induction of T and B cell responses

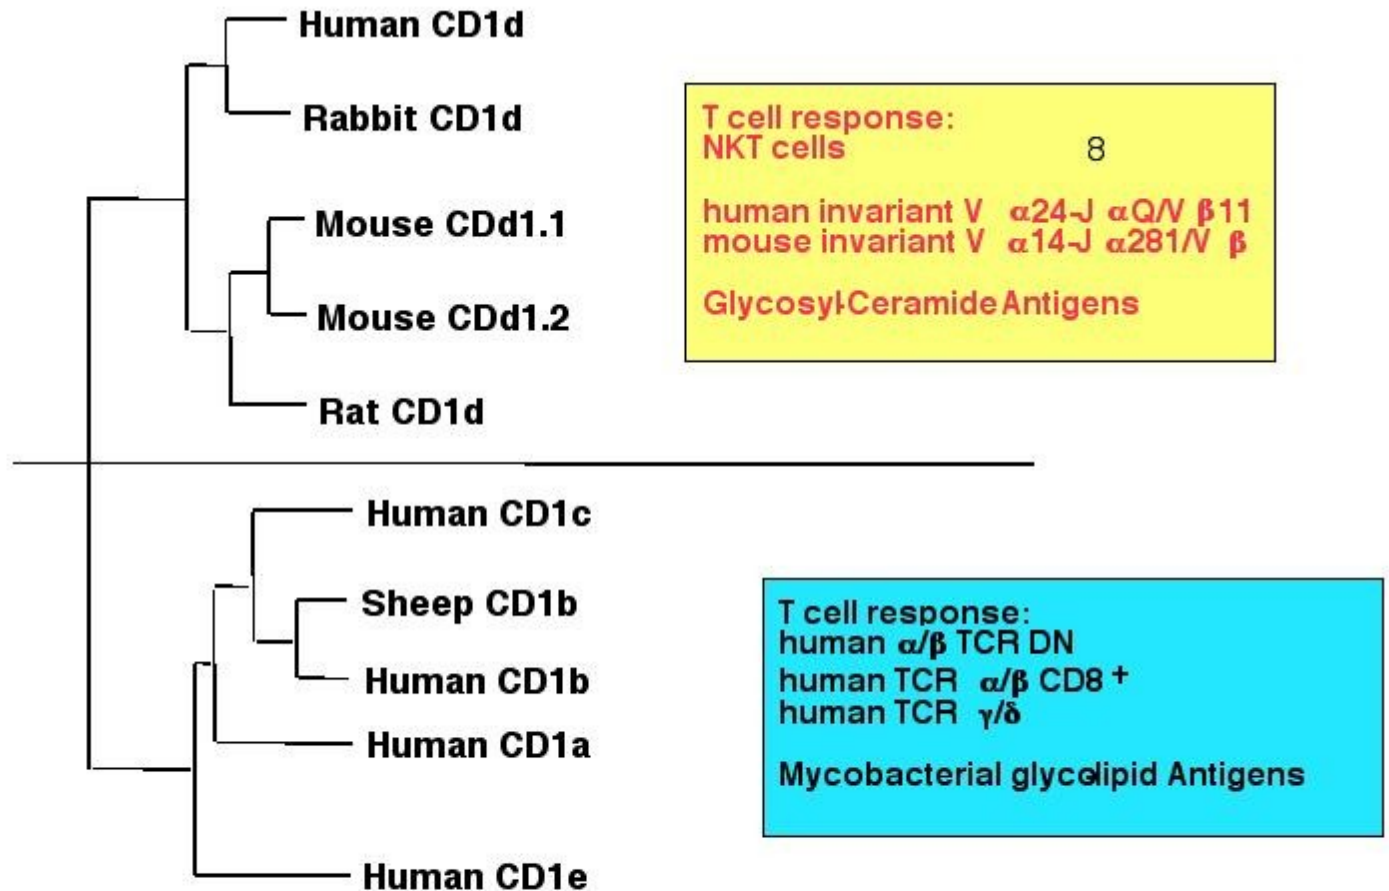

## NKT cells

**T cells =  $\alpha/\beta$  ( $\gamma/\delta$ ) TCR**

**NK cells = CD161 (NKPR1)**

Human CD1 genes: chromosome 1

Mouse CD1 genes: chromosome 3

*$\alpha$ -GalCer KIRIN7000*

## $\alpha$ -Galactosyl Ceramide

## Ganglioside GM<sub>1</sub>

Fig. 1 Structure of sphingolipids  $\alpha$ -GalCer and ganglioside GM<sub>1</sub>. The ceramide moiety is enclosed in the gray box and the  $\alpha$  or  $\beta$  anomeric linkage of the sugar is indicated.

Le cellule NKT differiscono dalle T convenzionali, poiché

**Sono sempre attivate**

**Sono già clonalmente espanse**

**Hanno sempre funzini effettrici immediate**

**In questo, sono simili alle cellule dell'immunità innata**

**Infiammazione  
Attivazione immune**

## Cellule NKT possono influenzare la maturazione delle DC nelle mucose

## Le cellule NKT possono influenzare l'induzione della risposta immune

## **Regulatory activity by inv. NKT cells**

**Activation of inv. NKT cells by  $\alpha$ -Gal Cer:**

**Induces anti-tumor responses**

**Potentiate malaria vaccines**

## Le cellule NKT possono influenzare l'induzione della risposta immune

## **Regulatory activity by inv. NKT cells**

**Activation of inv. NKT cells by  $\alpha$ -Gal Cer:**

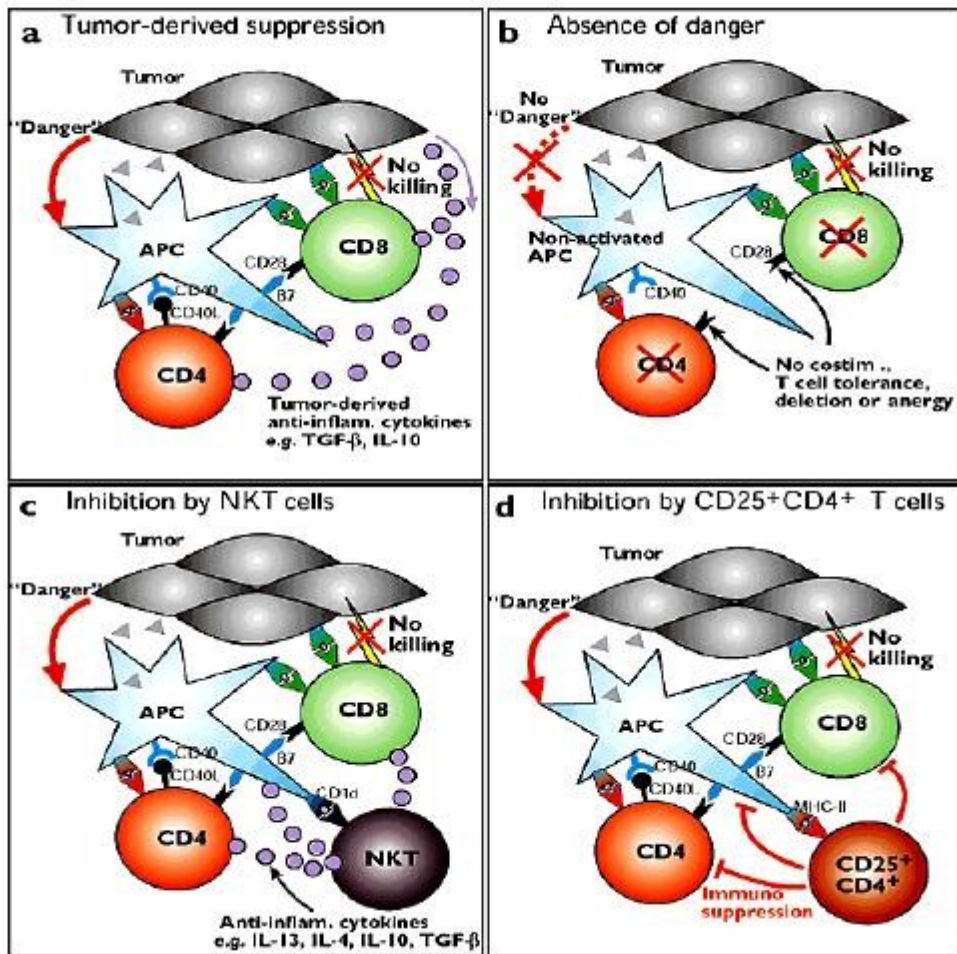

**Suppresses/delays type I diabetes**

**Suppresses/delays EAE**

## Le cellule NKT possono influenzare l'induzione della risposta immune

**Le cellule NKT hanno caratteristiche  
tipiche sia dell'immunità innata che adattativa**

**Hanno funzione regolatoria, producendo citochine  
pro- ed anti- infiammatorie**

**La loro manipolazione è possibile, e potrebbe avere  
interessanti risvolti futuri in terapia**
